## FORECAST SUPPORT GROUP VARIABLE NAMING

### CONVENTIONS AND DATA BANK DIRECTORY

This document first details the data bank and variable naming conventions adopted by the Forecast Support Group (FSG) of the Commodity Economics Division, ERS to facilitate its data related operations on the Wharton Econometric Forecasting Associates/Boeing Computer Services, Inc. (WEFA/Boeing) System and then provides a directory of the variables currently residing on its banks. Computer operations are preformed via telephone data terminals or the ERS dialup remote batch unit, which access the Boeing IBM 370/168 computer in McLean, Va. The data is also available on the DIS software. Contact the Data Services Division for access to the data at WCC.

The data being placed on the WEFA/BOEING System are comprised essentially of U.S. domestic prices and supply and disappearance statistics and other statistics to support the FSG models. Emphasis is being placed on collection of U.S. aggregate statistics with state, region, and city data placed on the system as required for empirical work. Specialized data for analytical support of individual program areas within CED has also been loaded into the system. Foreign data has been placed on the banks only on an as needed basis.

The FSG is differentiating its data as to frequency and history or forecast. Frequency refers to the number of observations per year (i.e., 1 = annual, 4 = quarterly, 12 = monthly). An annual historic data bank as well as quarterly and monthly historic data banks have been created. Annual and quarterly U.S. forecast data banks have been created for quarterly memo, and contingency analysis, model, futures price, and

estimates committee price, supply and disappearance forecasts. Note that as new statistics are placed on the banks for which specific naming conventions have not been anticipated, new codes will be identified following the same procedures as outlined herein. Thus, this document will be periodically updated to keep interested individuals up-to-date on our naming conventions. It is anticipated that this coding structure will form the basis for a more generalized and comprehensive set of naming conventions for ERS and that the variable codes for the data herein will be modified to conform to the ERS naming conventions. The following discussion details the FSG's data bank and variable names, descriptions, units and source for each variable on the three historic data banks.

#### Data Bank Names

All data bank names have three components--the account number, a descriptive identifier, and a frequency identifier. (All data on any one bank must be of the same frequency, hence a separate bank is required for monthly, quarterly, and annual data.) The components of the data bank name are separated by periods and may not contain embedded blanks.

1. Account Names--All of the general FSG central data banks will be maintained under account number "ERS001."
2. Descriptive identifier--The second part of the data bank name is a descriptive phrase to identify the contents of the bank. The phrase "USAG" will be used to describe a bank of historic U.S. agricultural data.
3. Frequency identifier--The frequency of the observations is the third component of the name, and is specified as follows: 1/

---

1/ The WEFA/BOEING data management system can also handle semi-annual and weekly data as well as cross sectional series.

monthly = "MON"  
quarterly = "QTR"  
annual = "ANN"

Hence, the following historic U.S. agricultural banks are currently on the system:

ERS001.USAG.ANN  
ERS001.USAG.QTR  
ERS001.USAG.MON

Unless otherwise indicated, all crop variables in the annual banks are quoted on a crop year basis (the individual crop years indicated in the title of the variable) and livestock variables on a calendar year. All variables in the quarterly banks, unless otherwise specified, are based on a calendar year quarter.

Note that Wharton also maintains nonagricultural data banks, information about which may be obtained by typing:

LIST 'CXD001.BANKS.INFO'

on the BOEING MAINSTREAM computer system or referring to WEFA data bank documentation manuals.

#### Variable Names

The name of a variable stored on a data bank may contain up to 15 alphanumeric characters. In order to avoid a massive dictionary of variable names and definitions, a systematic procedure has been developed for naming variables. Nonagricultural data will be named following the Wharton conventions, but the name will be preceded by a period. Agricultural data will be identified as follows.

The logic behind the naming convention was to provide variable names that would be as short as possible, could be easily deciphered, and would provide uniqueness. Thus, the variable names

are broken into character fields which provide specific information about the statistic. Wherever possible alpha characters were used to help facilitate breaking down a name. The particular sequence of fields comprising a name were chosen so that given the U.S. aggregate type of data being placed on the banks, the names would be as short as possible.

### Historic Variables

Ten of the fifteen characters of a historic variable name are broken into 6 fields of from one to three characters as illustrated below.

	F	F	F	F	F	F				
	I	I	I	I	I	I				
	E	E	E	E	E	E				
	L	L	L	L	L	L				
	D	D	D	D	D	D				
	1	2	3	4	5	6				
Character										
Position	1	2	3	4	5	6	7	8	9	10

Fields one, two, and three (columns 1 - 5) are generally all that will be required to reference data from the historic banks and the remaining fields may be left blank. Wherever one or more fields are not required to define a variable but are bordered on each side by character fields, a convention was adopted to place asterisks in the empty positions(s) since no name can have embedded blanks.

### Field 1 (3 characters)

Field one is the commodity (or aggregate) code derived as follows:

1. If the commodity name consists of one word, the first three letters of the word are used. (Note that conflicts may arise).

2. If the commodity name consists of two words the first two letters of the first word and the first letter of the second word are used.
3. If the commodity name consists of three words, the first letter of each word is used.

Reference Sheet A presents the commodity and product codes based on the above scheme. When a conflict occurs, an alternative code must be selected (e.g., COL is used for cotton). Note that field four is used to identify a particular grade or variety of a commodity. Documentation of current commodity grade and variety codes are presented in Reference Sheet D. Also note that the codes on the reference sheets will be expanded as the need arises.

#### Field 2 (1 character)

Field two identifies the major type (or category) of statistic. For example, a price series is identified by a P. Reference Sheet B contains a listing of the major type of statistics and their associated codes.

#### Field 3 (1 character)

Field three is a qualifier to the major type of statistic. Thus P in field 2 may be qualified by an F to indicate a farm price. This sub category descriptor is also listed on Reference Sheet B.

#### Field 4 (2 characters)

Field four contains a description or qualifier to the basic commodity code. These grade or variety designators are included in Reference Sheet D.

#### Field 5 (2 characters)

Field five is a location identifier and may identify a country, state, city, region, etc. If the field is blank, the U.S. is assumed. Aggregate

exports and imports in the U.S. banks are assumed to be from or to the U.S.

Location identifiers currently in use are presented on Reference Sheet C.

#### Field 6 (1 character)

Field six provides an additional code for a grade or variety designation, but is currently not being used. It is anticipated that its chief use will be to delineate products at the retail level.

#### Additional coding conventions

Note that the last five characters of the possible fifteen are not being used. Additional coding conventions could be used to more adequately handle very specialized statistics that the FSG does not currently anticipate using but may be desirable at some later date. One additional convention has been adopted in order to allow a time series of a particular quarter on a variable to be placed on an annual bank. Thus, if one wanted a time series of the first quarter observations on a variable, the name adopted above would have appended on to its last character position a 1 signifying the first quarter (e.g., third quarter observations on the U.S. corn farm price would be increased by the name CORPF3).

#### Forecast Variables

Variables that will be placed on the forecast data banks will have slightly altered naming conventions. In fact, two unique coding schemes exist for the identification of forecast variables. The first convention facilitates analytical use of current forecasts while the second convention facilitates efficient storage of forecasts over time.

#### Forecast Convention #1

A four character forecast descriptor containing three fields is appended on to the front of the historic name for which a forecast is being

made. The field specifications are:

F	F	F
I	I	I
E	E	E
L	L	L
D	D	D
1	2	3

Character Position	1	2	3	4
-----------------------	---	---	---	---

#### Field 1 (1 Character)

This field contains one alpha character which deliniates the forecaster as well as the alternative sets of assumptions underwhich the forecasts were made. The outlook and situation analysts base forecast is labeled by a B. The FSG cross commodity model base forecasts are labeled with an M and futures market forecasts are labeled with an F. Interagency Estimates Committee forecasts are identified by an I.

#### Field 2 (1 character)

This field consists of one numeric digit which specifies in what calendar year quarter the forecasts were made. If the forecasts for a variable were made during the fourth quarter 1975, a 4 would be placed in field two. Annual forecasts would have a 1 in this field which is consistent with the WEFA/BOEING convention for an annual frequency.

#### Field 3 (2 characters)

This field has two numeric digits which are the last two digits of the year in which a forecast was made. A forecast made during 1975 would be indicated by 75 in character positions 3 and 4.

Thus, a base set of forecasts on corn farm prices made during the fourth quarter of 1975 would be inputed in the appropriate forecast bank

under the name B475CORPF. CORPF is the historic name associated with the farm price of corn derived using the historic data naming conventions mentioned earlier. Because this naming convention through time produces a large number of variables with few observations, a second naming convention was adopted to retain forecasts on a historical perspective.

#### Forecast Convention #2

A two character forecast descriptor with two fields of one character each is appended onto the front of the basic historic name for which a forecast is being made.

The field specifications are:

F	F
I	I
E	E
L	L
D	D
1	2

Character Position	1	2
-----------------------	---	---

#### Field 1 (1 character)

This field is exactly the same as the first naming convention, i.e., an indicator of the forecaster and assumptions underwhich the forecasts are made. B is the outlook and situation analysts base forecasts, M is the cross commodity model forecasts, F is the futures forecasts, I is Interagency estimates.

#### Field 2 (1 character)

This field indicates the lead time by which the forecast was made prior to the actual event. Hence a zero indicates the forecasts were made during the quarter being forecast. A 3 indicates the forecasts were made three

quarters before the actual event.

With this convention, only four variables (eg. BOCORPF, BICORPF, BZCORPF, and B3CORPF) are required to identify all forecasts of a variable that are normally produced via the quarterly memo analysis.

1/ Major data type code is entered in the fourth position of the variable code name.

2/ Subcategory of data type code is entered in the fifth position of the variable code name.

3/ A standard convention has yet to be established. This will be dependent upon the ratios to be maintained on the bank. Generally, the first character of the commodity will be used, but numeric codes will be required where conflicts arise. The commodity placed in the numerator is delineated in the first three characters of the variable code name.

#### NONAGRICULTURAL DATA-

USED WHARTON CONVENTIONS PREFIXED BY A PERIOD

1/ A three digit specification of a commodity name entered into the first three digits of the vairable code name. In general, (1) when a commodity name is expressed in one word, use the first three letters, (2) if there are two words, use the first two letters of the first name and the first letter of the second name, and (3) if there are three words, use the first letter of each word.

2/ The grade, variety, ect. designation is a two digit alphanumeric code entered into the sixth and seventh position of a variable name. It is used to further delineate a major commodity name abbreviation.

3/ Including poultry.
